Acronyms and Abbreviations

bls	below land surface
COPC	contaminants of potential concern
DCE	dichloroethene
DOE	U.S. Department of Energy
DPE	dual-phase extraction
DPT	direct push technology
EPA	U.S. Environmental Protection Agency
FDEP	Florida Department of Environmental Protection
ft	feet
HPC	Heterotrophic Plate Count
HSWA	Hazardous and Solid Waste Amendment
IRA	Interim Remedial Action
µg/L	micrograms per liter
µmhos/cm	micromhos per centimeter
mg/L	milligrams per liter
mV	millivolts
NGVD	national geodetic vertical datum
NTU	Nephelometric Turbidity Units
PCIC	Pinellas County Industrial Council
PLFA	phospholipid fatty acids
RAP	Remedial Action Plan
RCRA	Resource Conservation and Recovery Act
RPD	relative percent difference
STAR Center	Young – Rainey Science, Technology, and Research Center
STL	Severn Trent Laboratories
TCE	trichloroethene
TCOPC	total contaminants of potential concern
VOCs	volatile organic compounds

1.0 Introduction

The Young - Rainey Science, Technology, and Research Center (STAR Center) is a former U.S. Department of Energy (DOE) facility constructed in the mid-1950s in Pinellas County, Florida. The STAR Center, while owned by DOE, primarily manufactured neutron generators for nuclear weapons. Other products manufactured at the STAR Center have included radioisotopically-powered thermoelectric generators, thermal batteries, specialty capacitors, crystal resonators, neutron detectors, lightning arrestor connectors, and vacuum switch tubes. In 1987, the U.S. Environmental Protection Agency (EPA) performed a Resource Conservation and Recovery Act (RCRA) Facility Assessment at the site to gather information on potential releases of hazardous materials. In February of 1990, EPA issued a Hazardous and Solid Waste Amendments (HSWA) Permit to DOE, enabling DOE to investigate and perform remediation activities in those areas contaminated by hazardous materials resulting from DOE operations. On March 17, 1995, DOE sold the facility to the Pinellas County Industrial Council (PCIC). The sales contract includes clauses to ensure continued compliance with Federal, State, and local regulations while DOE remediates the site. On July 1, 1999, the PCIC was disestablished and ownership of the STAR Center changed to the Pinellas County government. In November 2000, the State of Florida received HSWA authorization from the EPA. In January 2002, the state of Florida issued a new HSWA permit to DOE.

Administration of DOE activities at the facility is the responsibility of the DOE Idaho Operations Office. Responsibility for environmental restoration activities, conducted under the EPA RCRA Corrective Action Program of 1984, was transferred from DOE's Pinellas Area Office to DOE's Grand Junction Office in October 1997. S.M. Stoller Corporation (Stoller), a prime contractor to DOE's Grand Junction Office, provides technical support to DOE for remediation and closure of all active solid-waste management units on site and for the 4.5 Acre Site.

The STAR Center is a 99-acre facility located in Largo, Florida, and lies in the northeast quarter of Section 13, Township 30 South, Range 15 East ([Figure 1](#)). The 4.5 Acre Site is located to the northwest of the STAR Center ([Figure 2](#)). This parcel was owned by DOE from 1957 to 1972, at which time it was sold to a private landowner. During the period of DOE ownership, the property was used for disposal of drums of waste resins and solvents. As a result of this practice, the surficial aquifer was impacted by volatile organic compounds (VOCs), primarily vinyl chloride, toluene, trichloroethene (TCE), and 1,2-dichloroethene (DCE). DOE completed a source removal in 1985. An Interim Remedial Action (IRA) consisting of ground water extraction and treatment via air stripping, and a routine ground water monitoring program were initiated in May 1990. In July 1997, a modification of the IRA involving installation of dual-phase extraction (DPE) wells provided a more aggressive system to remove ground water contamination. In November 1999, the DPE/air-stripping system was replaced with an in-situ biosparge treatment system.

The *4.5 Acre Site Biosparge System Integration Plan* (DOE 2000a) was approved by Florida Department of Environmental Protection (FDEP) on January 17, 2001. This plan states that performance monitoring would be undertaken on a quarterly basis. Therefore, in April 2001, performance monitoring of the remedial system through the use of direct push technology (DPT) was undertaken. With this report, seven quarters of data have been collected. Samples of ground water were collected from 42 locations to depths up to 30 feet (ft) and were analyzed for VOCs and iron. Section 2.3 provides results from analysis of samples that were collected as part of these activities. Additional information related to the biosparge treatment systems is discussed in more detail in Section 3.0.

All activities associated with this site are conducted consistent with the FDEP *Corrective Actions for Contamination Site Cases* (FDEP not dated) and the *Remediation Agreement for the Four and One-Half Acre Site in Largo, Pinellas County, Florida, Between: State of Florida Department of Environmental Protection and U.S. Department of Energy* (FDEP 2001). Ground water cleanup at the 4.5 Acre Site is proceeding, in part, according to provisions in the document *Remediation Agreement for the Four and One-Half Acre Site in Largo, Pinellas County, Florida* (FDEP 2001), an agreement between DOE and the FDEP. The Remediation Agreement requires preparation of a Remedial Action Plan (RAP) to evaluate and select the final remedial action alternative to clean up ground water beneath the site to levels that are protective of public health and the environment. The RAP was completed in July 2001, and was approved by the FDEP in August 2001.

This document is the quarterly progress report for the 4.5 Acre Site for January through March 2003, as requested by the FDEP. The results of monitoring activities and a summary of ongoing and projected work are provided in this report.

1.1 Site Update

Seven new DPT locations (DP48–DP54) were added to the 4.5 Acre Site quarterly sampling in January as plume control assessment activities broaden along the northwestern portion of the site. Each new location was sampled at two target depths, 18–22 ft and 26–30 ft below land surface (bls). The DPT locations were sampled for VOCs and for the standard field parameters including field-measured iron. This was a one-time sampling event for these seven locations. Locations are shown on [Figure 3](#) and the results are shown in [Table 1](#).

In November 2002, the field work to collect additional data as part of a performance evaluation of the biosparge system was undertaken. The purpose of this performance evaluation was to address two questions: 1) to determine whether or not air is being delivered to the target zone and 2) to determine the fate of the contaminants of potential concern (COPCs) under aerated conditions. Six major tasks were accomplished as part of this evaluation. These tasks included:

- Installing in situ pressure transducers and water content reflectometers to test whether or not injected air is being evenly distributed in the subsurface;
- Analyzing soil samples to determine the chemical/biochemical oxygen demand in the subsurface and the associated impact of these demands on the injected oxygen;
- Installing six one-inch diameter monitoring wells to directly observe oxygen and VOC concentration changes during biosparge operations;
- Determining biodegradation rates and oxygen consumption rates utilizing microcosm experiments with site soils and ground water;
- Performing biological characterization by determining the phospholipid fatty acid (PLFA) concentrations of subsurface sediments; and
- Determining VOC concentrations in soil gas at selected areas of the site.

The report presenting the results of this study is now complete (DOE 2003b), and the results are summarized below.

The goal of biosparging is to convert subsurface conditions from anaerobic to aerobic to facilitate biodegradation of the COPCs. However, several lines of evidence from the study suggest that the subsurface system at the 4.5 Acre Site remains anaerobic:

- (1) High concentrations of chemical oxygen demand and total organic carbon in ground water and soil
- (2) No visual evidence of iron oxidation
- (3) Low dissolved oxygen and oxidation/reduction potential values measured in ground water
- (4) Anaerobic microbial signature from PLFA analysis
- (5) Ground water dissolved oxygen remained low and air-phase oxygen failed to react in long-term microcosm tests
- (6) Limited, if any, decrease in aqueous concentration of vinyl chloride.

The presence of bubbling wells as much as 200 ft from the biosparge wells indicates that air is being released through preferential channels. The fine-grained nature of the sediments probably limits the ability of air to flow through the porous media except through channels.

The results of this study indicate that the biosparging system has not converted subsurface conditions from anaerobic to aerobic, and that it is unlikely that the system will accomplish this goal in the future. The system likely is having some positive effect by sparging small amounts of VOCs. Additionally, the agitating effect of air injection appears to be locally mobilizing contaminants so that they are more available for naturally-occurring reductive biodegradation to occur.

During the next quarter, an independent evaluation of the 4.5 Acre Site biosparging system will review the historical ground water and soil data, the biosparge system design and construction, and the recent performance assessment report. Following the comprehensive review, the independent evaluation will culminate in a report that provides an evaluation of the current status of the biosparging system, makes appropriate recommendations as to whether the project should continue to operate, and, if the project is to continue, provide direction as to how the biosparging system will be used to attain the remediation goals.

1.2 Quarterly Site Activities

- Obtained water-level measurements from all monitoring wells on January 6-7, 2003.
- Conducted the quarterly sampling event (i.e., collected ground water samples from 23 monitoring wells and 60 ground water samples from 35 DPT sample locations) in January 2003 for analysis of VOCs. Twenty-five monitoring wells were sampled for arsenic and lead.
- Collected 14 samples from seven additional DPT locations that were placed to gather information for plume delineation.

- Collected field parameter and iron data from all DPT locations to evaluate geochemical conditions during active biosparging.
- Reported the results of quarterly sampling events (this document).
- Performed preventive maintenance on the biosparge systems throughout the quarter.

2.0 Monitoring Data

2.1 Ground Water Elevations and Flow

Within a 31-hour period on January 6-7, depth-to-water measurements were taken in all monitoring wells at the 4.5 Acre Site as part of the sitewide quarterly sampling event. The depth to water in each well was measured with an electronic water-level indicator. The January ground water elevation data for the 4.5 Acre Site are listed in [Table 2](#). The data and information from deep wells were used to construct contours of water levels in the deep surficial aquifer in [Figure 4](#).

The water levels were measured 3 and 4 days following shutdown of the biosparging system on January 3, 2003. The interpretative flow patterns shown on Figure 4 indicate a slight ground water low in the east-central part of the site (around monitoring well PIN20-M049), with ground water flowing towards this low from the north and east. These flow patterns suggest that ground water in the center of the site was displaced by air from the biosparging system, and 3 days following system shutdown, water was still flowing towards this hydraulic low. This flow pattern is consistent with the patterns observed the previous six quarters. Under static, non-pumping conditions, ground water at the site has historically been observed to flow to the north-northwest with no hydraulic low in the center of the site.

The water table ranged from about 1 to 4 ft bls, with ground water elevations that ranged from a high of 17.62 ft at PIN20-TE01 to a low of 14.74 ft at PIN20-MWL3. The hydraulic gradients in the south and north areas of the site were approximately 0.010 and 0.004 feet per foot, respectively. These gradients are similar to those observed in October 2002. Using Darcy's Law, along with approximations of 1 ft/day for hydraulic conductivity and 0.3 for effective porosity, ground water in the south part of the site is estimated to move about 12 ft/year, which is just slightly greater than previously observed velocities of 6 to 10 ft/year.

2.2 Ground Water Sampling

Twenty-five monitoring wells and 42 DPT locations were sampled by Stoller personnel in January 2003. Seven of the DPT locations were one-time locations sampled to aid in plume delineation. With the exception of one DPT location, all DPT locations were sampled at approximately 26 to 30 ft bls and a selected subset of 32 DPT locations were also sampled at approximately 18 to 22 ft bls (total of 74 DPT ground water samples). DP23 was sampled at 19 to 23 ft. All DPT locations were filled with bentonite chips after sampling. The sampling screen depths bls are used as part of the identifier for the DPT locations for the tables in this report.

All samples were collected in accordance with the Stoller *Sampling Procedures for the Young - Rainey STAR Center* (DOE 2002), using FDEP procedures. With the exception of two samples, all samples collected were submitted to Severn Trent Laboratories (STL) for analysis of VOCs using EPA Method 8021. Samples from PIN20-M007 and -M40S were only analyzed for arsenic and lead. STL is accredited by the Florida Department of Health in accordance with the National Environmental Laboratory Accreditation Conference, certification number E84282.

The monitoring wells were micropurged with dedicated bladder pumps and the samples were collected when the field measurements stabilized. DPT locations were purged using a peristaltic pump and sampled when the field measurements stabilized. Table 3 lists measurements of pH, specific conductance, dissolved oxygen, oxidation/reduction potential, turbidity, and temperature recorded at the time each sample was collected. These measurements were collected using a flow cell and multiparameter meter. Values for total iron and ferrous iron were measured at the DPT locations using a colorimeter and are discussed in Section 2.4.

2.3 Ground Water Analytical Results

Individual COPC and total COPCs (TCOPCs) concentrations in samples collected from wells and direct-push locations at the 4.5 Acre Site are included in Table 4. The previous four quarters of results are included in Table 4 for comparison. Figure 3 shows the TCOPCs concentrations.

No COPCs were detected in samples from the 47 sample locations listed below (some results listed in Table 1 and Table 4).

PIN20-0503	PIN20-DP24 18 ft	PIN20-DP49 22 ft	PIN20-M012
PIN20-DP03 18 ft	PIN20-DP28 18 ft	PIN20-DP50 18 ft	PIN20-M015
PIN20-DP03 24 ft	PIN20-DP29 18 ft	PIN20-DP50 23 ft	PIN20-M019
PIN20-DP04 25 ft	PIN20-DP29 22 ft	PIN20-DP51 18 ft	PIN20-M023
PIN20-DP08 23.5 ft	PIN20-DP30 18 ft	PIN20-DP51 23 ft	PIN20-M024
PIN20-DP09 26 ft	PIN20-DP30 22 ft	PIN20-DP52 18 ft	PIN20-M025
PIN20-DP10 25 ft	PIN20-DP31 18 ft	PIN20-DP52 23 ft	PIN20-M035
PIN20-DP13 18 ft	PIN20-DP32 18 ft	PIN20-DP53 18 ft	PIN20-M036
PIN20-DP13 25 ft	PIN20-DP33 18 ft	PIN20-DP53 21 ft	PIN20-M054
PIN20-DP16 22 ft	PIN20-DP34 18 ft	PIN20-DP54 18 ft	PIN20-MWL5
PIN20-DP17 18 ft	PIN20-DP34 23 ft	PIN20-DP54 22 ft	PIN20-MWL6
PIN20-DP19 23 ft	PIN20-DP49 18 ft	PIN20-M011	

Samples from 50 sample locations listed below contained COPCs at detectable levels (some results listed in Table 1 and Table 4).

PIN20-0502	PIN20-DP12 18 ft	PIN20-DP22 26 ft	PIN20-DP48 18 ft
PIN20-DP01 18 ft	PIN20-DP12 25 ft	PIN20-DP23 19 ft	PIN20-DP48 22 ft
PIN20-DP01 23 ft	PIN20-DP14 18 ft	PIN20-DP24 22 ft	PIN20-M001
PIN20-DP02 18 ft	PIN20-DP14 23 ft	PIN20-DP25 18 ft	PIN20-M049
PIN20-DP02 23 ft	PIN20-DP15 18 ft	PIN20-DP25 22.5 ft	PIN20-M053
PIN20-DP05 23 ft	PIN20-DP15 22 ft	PIN20-DP26 26 ft	PIN20-M18D
PIN20-DP06 18 ft	PIN20-DP17 23 ft	PIN20-DP27 22 ft	PIN20-M22D
PIN20-DP06 23 ft	PIN20-DP18 18 ft	PIN20-DP28 22 ft	PIN20-MWL1
PIN20-DP07 18 ft	PIN20-DP18 22 ft	PIN20-DP31 22 ft	PIN20-MWL2
PIN20-DP07 23 ft	PIN20-DP20 18 ft	PIN20-DP32 22 ft	PIN20-MWL3
PIN20-DP08 18 ft	PIN20-DP20 24 ft	PIN20-DP33 23 ft	PIN20-MWL4
PIN20-DP11 18 ft	PIN20-DP21 18 ft	PIN20-DP35 18 ft	
PIN20-DP11 25 ft	PIN20-DP21 23 ft	PIN20-DP35 22 ft	

The maximum TCOPCs value detected was 296,000 micrograms per liter ($\mu\text{g/L}$) at PIN20–DP12 25 ft. The compound detected at the highest concentration in PIN20–DP12 25 ft was cis-1,2-DCE at a concentration of 280,000 $\mu\text{g/L}$.

The monitoring wells were also sampled for arsenic and lead ([Table 5](#)) as specified in the historical review of COPCs (DOE 2003a). Arsenic was detected in only three of the 25 wells, PIN20–0502, –0503, and –MWL3. The maximum arsenic concentration detected was 0.024 milligrams per liter (mg/L) in PIN20–0503. Lead was detected in 10 wells. The maximum concentration of lead detected was 0.023 mg/L in PIN20–M035. Reported “J” values are not considered in the total COPC analyte concentrations.

Laboratory reports for quarterly samples collected in January 2003 are provided in [Appendix A](#).

2.4 Geochemical Parameters

As discussed in the July to September 2002 quarterly report, Heterotrophic Plate Count (HPC) analysis was discontinued following the July 2002 sampling event. As part of the performance evaluation, soil samples were collected during November 2002 for analysis of PLFA. The results of the PLFA analysis indicated that only anaerobic bacteria were active in the area that was evaluated. This result agrees with the other geochemical data that were collected concurrent with the PLFA data. The PLFA analysis is a potential candidate to replace the HPC analysis. However, collection of PLFA samples is problematic, requiring that soil cores be collected at depth. Additionally, the results of the performance evaluation indicated that the other geochemical parameters, such as dissolved oxygen, oxidation-reduction potential, and iron species, are sufficient to monitor the conversion from anaerobic to aerobic conditions. Therefore, microbial analyses associated with the biosparging system are being discontinued.

Also as part of the regular annual monitoring, samples for field analysis of dissolved total and ferrous iron were collected during the DPT sampling. Collection of these data is intended to monitor conversion from reducing to oxidizing conditions during biosparging. As the biosparging system continues operation, the reduced iron should be converted to oxidized iron. The measured iron values and the calculated percent of oxidized iron are shown with the rest of the field measurements in Table 1 and Table 3.

2.5 Quality Assurance/Quality Control

Seven duplicate samples were compared and the relative percent differences (RPDs) between the results were calculated. Results of analysis for each duplicate sample are listed in [Table 6](#). From the seven duplicate samples, 265 individual compounds were analyzed. None of the compounds failed the suggested control limit of an RPD of less than 30 percent when the concentration was greater than 5 times the detection limit. All data are considered Class A level, indicating that the data may be appropriately used for quantitative and qualitative purposes.

According to the Stoller Sampling Plan, duplicate samples should be collected at a frequency of one duplicate for every 20 or less samples. There were 23 ground water VOCs, 25 arsenic and lead samples collected from standard monitoring wells, and three duplicate samples. For the DPT locations, there were 74 VOCs samples collected and four duplicate samples, therefore, the duplicate criteria were met.

Five trip blanks and five equipment blanks were submitted for analysis. Only one blank showed an estimated value for methylene chloride. This is significantly better than the October 2002 results when seven out of nine blank samples showed estimated quantities of methylene chloride. Estimated quantities are above the analytical method detection limit but below the reporting limit. One equipment blank collected on January 9, 2003, showed estimated quantities of seven volatile compounds and arsenic. All other equipment blanks were nondetect for all compounds.

3.0 Biosparge System Operation

3.1 Biosparge System Performance

The biosparge systems at the 4.5 Acre Site were continuously operational throughout the quarter, with two exceptions. The biosparge systems were shut down for quarterly sampling activities from January 3 through 10, 2003. Upon completion of sampling on January 10, the biosparge operations were restarted.

Additionally, over the weekend of February 8 and 9, the blower failed at Biosparge System 1. Upon discovery of the failure on February 10, biosparge operations at System 1 were restarted with compressed air. This continued until February 24, when System 1 was switched over to operation with a new blower.

3.2 Biosparge System Sampling and Monitoring

As described in the previous quarterly report, the Interim Remedial Action Plan Addendum for the 4.5 Acre Site outlined sampling and monitoring activities to monitor biosparging activities. The *4.5 Acre Site Biosparge Monitoring Report* (DOE 2000b), presents the data collection activities associated with the biosparging system start-up, analyzes the monitoring results, and makes recommendations for continued operations. This report was issued in July 2000. Subsequently, biosparging activities will be monitored on a quarterly basis during regular quarterly sampling events.

4.0 Tasks to be Performed Next Quarter

The following tasks are scheduled during the next quarterly period (April through June 2003).

- Sampling and analysis of ground water and water level measurements in early April.
- Conduct independent evaluation of biosparging operations.
- DPT sampling of ground water.
- Routine preventive maintenance activities.

^atemperature corrected to 25°C^bTotal 1,2-DCE is the sum of cis-1,2-DCE and trans-1,2-DCE^cTotal COPC is the sum of the individual COPC concentrations. The cis-1,2-DCE and trans-1,2-DCE values are not part of the Total COPC value because these values are included in the Total 1,2-DCE value. "J" values are not included in the Total COPC value.^dFerrous Iron > Total Iron

ND = Not detected.

J = Estimated value, result is between the reporting limit and the method detection limit.

^aTotal 1,2-DCE is the sum of cis-1,2-DCE and trans-1,2-DCE.

^bTotal COPC is the sum of the individual COPC concentrations. The cis-1,2-DCE and trans-1,2-DCE values are not part of the Total COPC value because these values are included in the Total 1,2-DCE value. "J" values are not included in the Total COPC value.

ND = Not detected.

J = Estimated value, result is between the reporting limit and the method detection limit.

B = Analyte also found in method blank.

-- = No Data.

^aS = Original sample (N001), VOC concentration in µg/L.

^bD = Duplicate sample (N002), VOC concentration in µg/L.

^cDL = Detection limit.

^dFail is an RPD greater than ±30% and an original or duplicate sample more than 5 times the detection limit.
